SAFETY VALVE

4000 SERIES

USE AND MAINTENANCE MANUAL

FORM 045-IN. 10/01

SAFETY VALVE FOR LIQUID SERVICES

Characteristics

- Overpressure 10%;
- blowdown 10%;
- spring range ± 10% of set pressure;
- liquid discharge coefficent k= 0,6;
- connections : ANSI, UNI, DIN, etc.

Accessories

- Test gag ;
- soft seat ;
- balancing bellows ;
- heating jacket.

CHARACTERISTICS AND PRESSURE LIMITS							
Orifice			Lift	Max. set	Max. backpressure		
Туре	Ø	Area		pressure	without bellows	with bellows

The max. capacity is calculated for water at 4° C, with 2 ÷ 3 m/sec max velocity and DP min. of 1,5 kg/cm².

4000 SERIES SAFETY VALVE

The valve of **4000 Series** are particularly suitable for use as maximum pressure and back-pressure valves for reciprocating metering pumps.

They are full nozzle and flat seat type, with closed bonnet and spring insulated by a seal ring.

The body and the bonnet of 3/8"-1/2" stainless steel valves are obtained from precision casting.

The valves are produced in metal materials (carbon steel, stainless steel, super alloy, etc.), and in plastic materials (PVC, Polypropylene, Ptfe, etc.) suitable for aggressive liquids.

Valves are available with threaded connections (GAS or NPT) and flanged connections (UNI-DIN or ANSI).

A special version with heating jacket, insulating bellows and incorporated flanges is provided for special applications, for example for viscous or heated liquids.

1. ISTALLING

Before installing the valve on the plant make sure that:

- the line fluid is indicated on the construction declaration or is suitable with what stated in it;
- the inlet piping of the valve is devoid of impurities, slag etc. and eventually remove them;
- the inlet and discharge piping are dimensioned in such a way that they generate the minimum possible loss of pressure.

In case the value that is going to be installed is a **threaded type** use for tightening the key of the nozzle (1); if the value is a **flanged type** tighten the bolts in a uniform way.

Once the valve has been installed on the plant make sure that:

- the discharge is not positioned in such a way to result dangerous for people or for instruments;
- the discharge is properly conveyed.

1.1 SETTING UP

Before shipment all the safety valves are hydrostatically tested and set at the setting pressure required by the Client. Therefore regulation in loco should be necessary.

The maximum setting error is less than 3% for pressure up to 21 bar, with a minimum of 0,2 bar; it is less than 0,7 bar up to 70 bar; it is less than 1% for pressure over 70 bar.

In case it should be necessary to modify the set pressure or the re-closure pressure of the valve (blowdown), it should be necessary proceed as follows:

1.1.1 setting regulation (referring to drawing)

In order to carry out setting regulation of the valve it is necessary:

- remove the cap (15) and unloosen the lock nut (17);
- turn the adjusting screw (12) clockwise in case the set pressure should be increased ;
- turn the adjusting screw (12) counter-clockwise in case the set pressure should be decreased.

The adjustment range of the spring setting is \pm 10 % of the set pressure indicated on the label of the valve. Once the valve setting is regulated tighten the lock nut (17) and re-screw the cap (15).

2. DISASSEMBLING

2.1 VALVE WITHOUT ACCESSORIES

In order to execute disassembling carry out progressively the following operations:

CAUTION : before disassembling the valve make sure that the plant on which it is mounted is not "under pressure" and that no pressure inside the valve itself has remained.

- remove the valve from the plant ;
- remove the cap (15) and unloosen the lock nut (17) and the adjusting screw (12);

CAUTION : before disassembling the bonnet of the valve body make sure that the spring (11) is totally released using the adjusting screw (12).

- remove the screw (18), the bonnet (14) and extract all the internal parts;
- remove the nozzle (1).

tecHnical

2.2 VALE WITH SOFT SEAT

In order to execute disassembling carry out progressively the following operations:

CAUTION : before disassembling the valve make sure that the plant on which it is mounted is not "under pressure" and that no pressure inside the valve itself has remained.

- remove the valve from the plant ;
- remove the cap (15) and unloosen the lock nut (17) and the adjusting screw (12);

CAUTION : before disassembling the bonnet of the valve body make sure that the spring (11) is totally released using the adjusting screw (12).

- remove the screw (18), the bonnet (14) and remove all internal parts;
- remove the bell (20) from the disc (2) and remove the gasket (21);
- remove the nozzle (1).

3. ASSEMBLING

3.1 VALVE WITHOUT ACCESSORIES

For assembling carry out the same operations of point **2.1**) but in reverse order, tightening first the nozzle (1) to the body (4); mounting the internal parts inserting firstly, from the convex part, the seal ring (5) in the guide (8) and only secondly the stem (3) and the disc (2).

3.2 VALVE SOFT SEAT

For assembling carry out the same operations of point **2.2**) but in reverse order, tightening first the nozzle (1) to the body (4); mounting the gasket (21) the bell (20), on the disc (2) later mounting the internal parts inserting firstly, from the convex part, the seal ring (5) in the guide (8) and only secondly the stem (3) and the disc (2).

4. MAINTENANCE

The safety valves requires an ordinary but careful maintenance (**SEE MAINTENANCE PLANT**) and in case it would be necessary, follow the operation stated in point **2**) for disassembling and in point **3**) for assembling. In case of seats damaging it is necessary to carry out a new lapping: this operation has to be executed by skilled workers.

In case inconvenience should occur to the valve, verify if in the **DAMAGES TABLE** are contained some useful instructions for solving the problem.

In case the inconvenience is of different nature from what stated in the table, contact our Service Dept.

WARNING

- The safety valves should not be subjected to bumps or such stresses that could compromise the working.
- High loads on the spring can damage the valve.
- The safety valve must be used only exclusively for the use stated in the construction declaration.
- The safety valve must be revised within two years from installation independently from the number of interventions executed by the valve.

ACCESSORIES

SOFT SEAT

JACKET

BELLOWS

ORDINARY MAINTENANCE PLAN

Check of the seat and disc on the plant	Every valve opening or every 6 months working.
Check of the seal outwards in case of back pressure on the plant	Every 30 days.
Check of the painting condition on the plant.	Every 6 months.
Ordinary maintenance of the assembled on the plant, including the seal check and surface check of the movable components.	Every 12 months working.
General maintenance of the valve removed from the plant including the disassembling, the seat and the disc check, the possible seat and disc lapping, gaskets substitution, painting restoration and inspection on the test bench.	Every opening with seats damaging or every 24 months working.

DAMAGES TABLE						
INCONVENIENT	POSSIBLE DAMAGE	ACTION TO BE CARRIED OUT				
Fluid leakage in line	Sea wear and tear	Nozzle substitution or revision				
	Disc wear and tear	Disc substitution or revision				
	Seat and disc damaging	Nozzle and disc revision				
	Impurities presence between seat and disc	Nozzle and disc cleaning and revision				
	Valve used with fluid different from the one stated in the purchase order	Nozzle and disc revision				
External back pressure	Bellows breakage	Bellows substitution				
fluid leakage	Valve gasket damaging	Gasket substitution				
	Valve body and bonnet damaging	Valve revision or substitution				
	Cap loosen	Check and setting up of the cap.				
Opening at pressure value different from setting valve	Back pressure changeable	Check of dimensioning and of the discharge piping working conditions and possible valve substitution with another balanced type.				
	Spring release	Spring substitution and check compatibility of the material with the fluid.				
	Setting screw withdraw	Resetting the valve and tighten very well the lock .nut				
Valve intervention with	Strong loss load in the inlet piping	Check the inlet piping length				
quick opening and re-closures repeated in	Pulsating flow rate to be discharge	Check plant regulation				
the time	Over-dimensioned valve	Substitute the valve with one correctly dimensioned.

Note :

- 1 Available with stellited seat codice H6
- 2 Available with stellited trim codice 6K
- **3** For all valves with heating jacket gaskets are in **Aramidic Fibre**.
- 4 For valves in class 16 and 60 with heating jacket, the cap is in AISI 303.
- **5** For 3/8"-½" valves, the bonnet is integral with the bonnet flange.
- 6 For valves in 76 class with isolating bellows, the stem is in AISI 303.
- **7** For 3/8"-1/2" values in 16 and 60 class, the body is in **AISI 316.**
- **8** In the valves with soft seat, depending on the fluid characteristics, the o-ring can be supplied also in other material.
